
KiCad does not support reference designators starting with a number. Therefore the references used in the original schematics have been mirrored. 6R -> R6. The original schematics had separate pages for the main and video PCB. They are combined here. This makes some references duplicate. To distinguish between boards A_ is added before part positions on PWB(A) and for PWB(B) B_ and so on. If there are still conflicts a "P" (Position) is added after board letter AP_, BP. Sometimes there are duplicate reference designators then "CAP" maybe added after board letter ACAP_ (CAP is for capacitor).

There are several games and variations on the twin 16 platform:
- Main Board PWB(A)
- Video Board PWB(B)
- Additional ROM Board, if not ROM's mounted directly on video board.
- Battery powered RAM board

	Id	PWB(A)	PWB(B)	PWB(C)
Dark Adventure	GX687	302190A	302191A	–

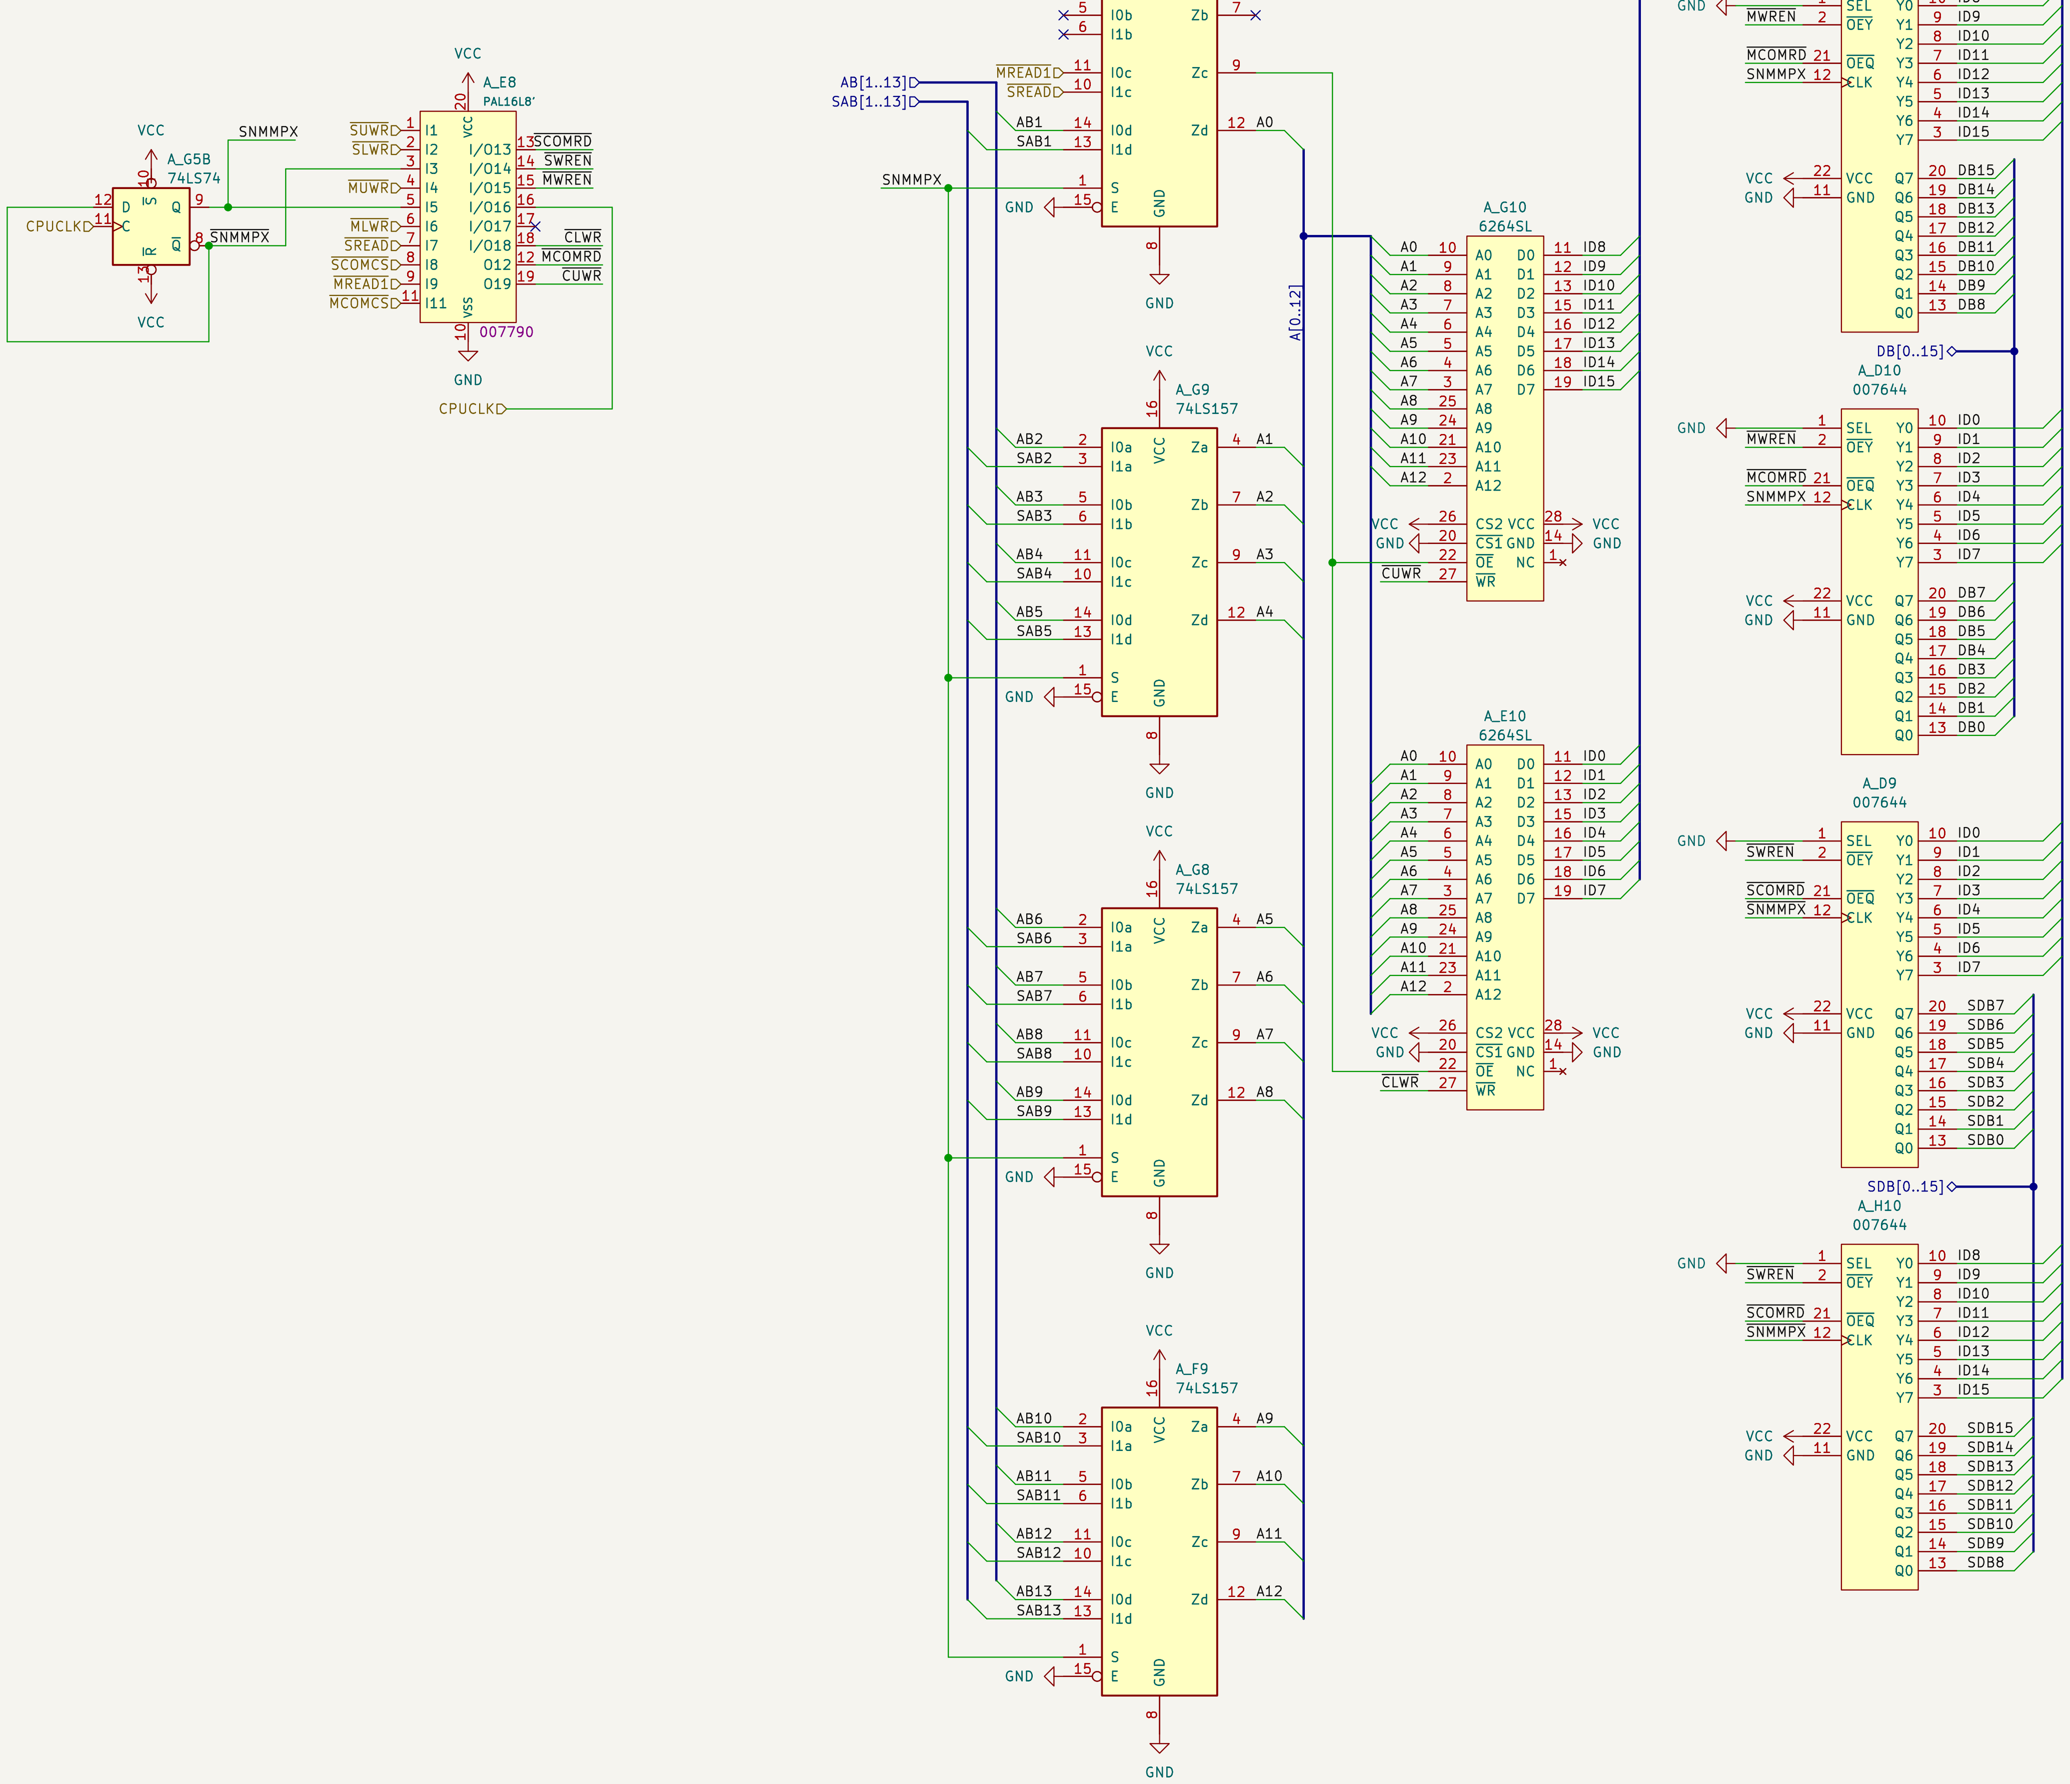
Konami 007790

```
MCOMRD = ~(~MREAD1 & ~MCOMCS) = MREAD1 | MCOMCS
SCOMRD = ~(~SREAD & ~SCOMCS)
SWREN = ~(~SNMMPX & SREAD & ~SCOMCS)
MWREN = ~(~SNMMPX & MREAD1 & ~MCOMCS)
CLWR = ~(~SLWR & ~SNMMPX & SNMMPX & SREAD & ~SCOMCS & ~CPUCLK | ~SNMMPX & ~MLWR & MREAD1 & ~MCOMCS & ~CPUCLK)
CUWR = ~(~SUWR & ~SNMMPX & SNMMPX & SREAD & ~SCOMCS & ~CPUCLK | ~MUWR & ~SNMMPX & MREAD1 & ~MCOMCS & ~CPUCLK)
```

All AND logic can be converted to OR form. But since AND logic and inverters are used in the PAL16L8 device it is kept in that form.
The equations follow verilog syntax. The active low signals are not inverted, the bar is there only to show activeness.



This is from jammarcade.net

Pin 1 = SEL – changes whether the Q outputs require a rising edge clock or not.
Pin 2 = OEY – Output enable for the Y outputs else they are inputs. Active LOW
Pin 21 = OEQ – Output enable for the Q (clocked) outputs else they are inputs. Active LOW
Pin 12 = CLK – Clock input

Pins 3–10 = Y outputs – normal outputs. If OEY is LOW these pins become outputs mirroring the state of the Q input pins. SEL and CLK pins are not used in this mode.

Pins 13–20 = Q outputs – clocked outputs. If OEQ is LOW these pins become outputs.
If SEL is HIGH and CLK is HIGH these outputs will mirror the state of the Y inputs.
If SEL is LOW then the outputs will only change state on a rising edge CLK.

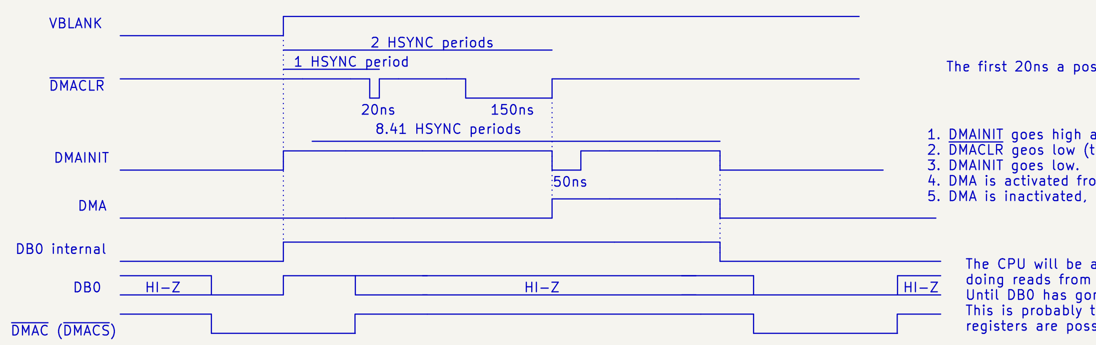
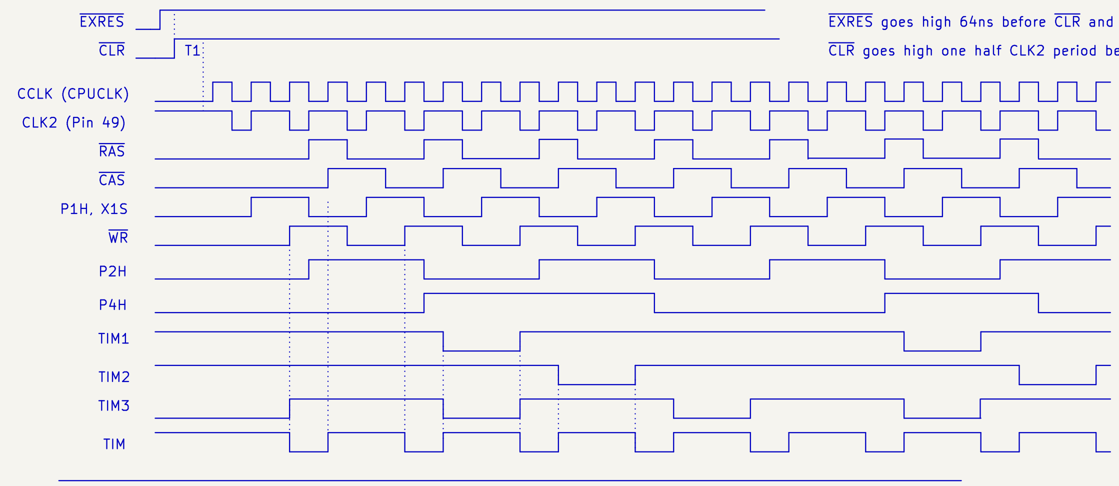
DMA Synchronization



The first 20ns a possible glitch?

1. DMAINIT goes high after VBLANK goes active
2. DMACLR geos low (the second time) and high after 150ns.
3. DMAINIT goes low.
4. DMA is activated from the 00783(Sprite engine).
5. DMA is inactivated, DMAINIT, DB0 internal goes low.

The CPU will be activating regularly DMACS, doing reads from the system registers periodically. Until DB0 has gone from low to high and low again. This is probably to check if writes to the sprite controller registers are possible.



EXRES goes high 64ns before CLR and stays high.

CLR goes high one half CLK2 period before the first falling edge of CLK2.

CCLK = 18.432MHz / 2 = 9.216MHz
CLK2 = 18.432MHz / 3 = 6.144MHz,
T = 1/f = 162.76ns, T = 2 x T1
f = CLK2 / 2 = 3.072MHz, T2 = 3 x T1

f = CLK2 / 2 = 3.072MHz
f = CLK2 / 2 = 3.072MHz
f = CLK2 / 4 = 1.536MHz
f = CLK2 / 8 = 768kHz
f = CLK2 / 8 = 768kHz
f = CLK2 / 8 = 768kHz
f = CLK2 / 4 = 1.536MHz
f = CLK2 / 2 = 3.072MHz

Timer	Usage
TIM1	Main CPU Tilemap RAM access
TIM2	Slave CPU RAM Tilemap RAM access
TIM	Sprite timing/address generator 007783
TIM3	Sprite timing/address generator 007783

Output enables active vs. part of frame buffer active

ZIP RAM

256kB tile RAM
16-bit access by CPU
32-bit access by video

CPUCTL flag must be set in 007779 to get the VA bus driven by the CPUs

VD[0..12]: Tile number
VD[13..15]: Palette Color

Outputs of RAM active when P4H is low, i.e during T1 and T2.

SYNCRLDV: Usually 60.6042Hz
T is ~150ns.

VCNTEN: 8.0000kHz

HSYNC: 16.0000kHz, T2: 5.2175us

Data latched from the RAM:

Edge	Tilemap
T1-T2	1
T2-T3	2

It is output 2 pixel clocks later to the ROMs.

When VA is switched to output the bus is updated for each P1H cycle.

The vertical counters are not the same value when they are offset with the scroll registers.

Tilemap 1 and 2
VA[5..0]: Horizontal position: 0..63 -> 0..63 x 8 = 0..504
VA[11..6]: Vertical position: 0..63 -> 0..63 x 8 = 0..504
VA12 = 0: Tilemap 1, VA12 = 1: Tilemap 2

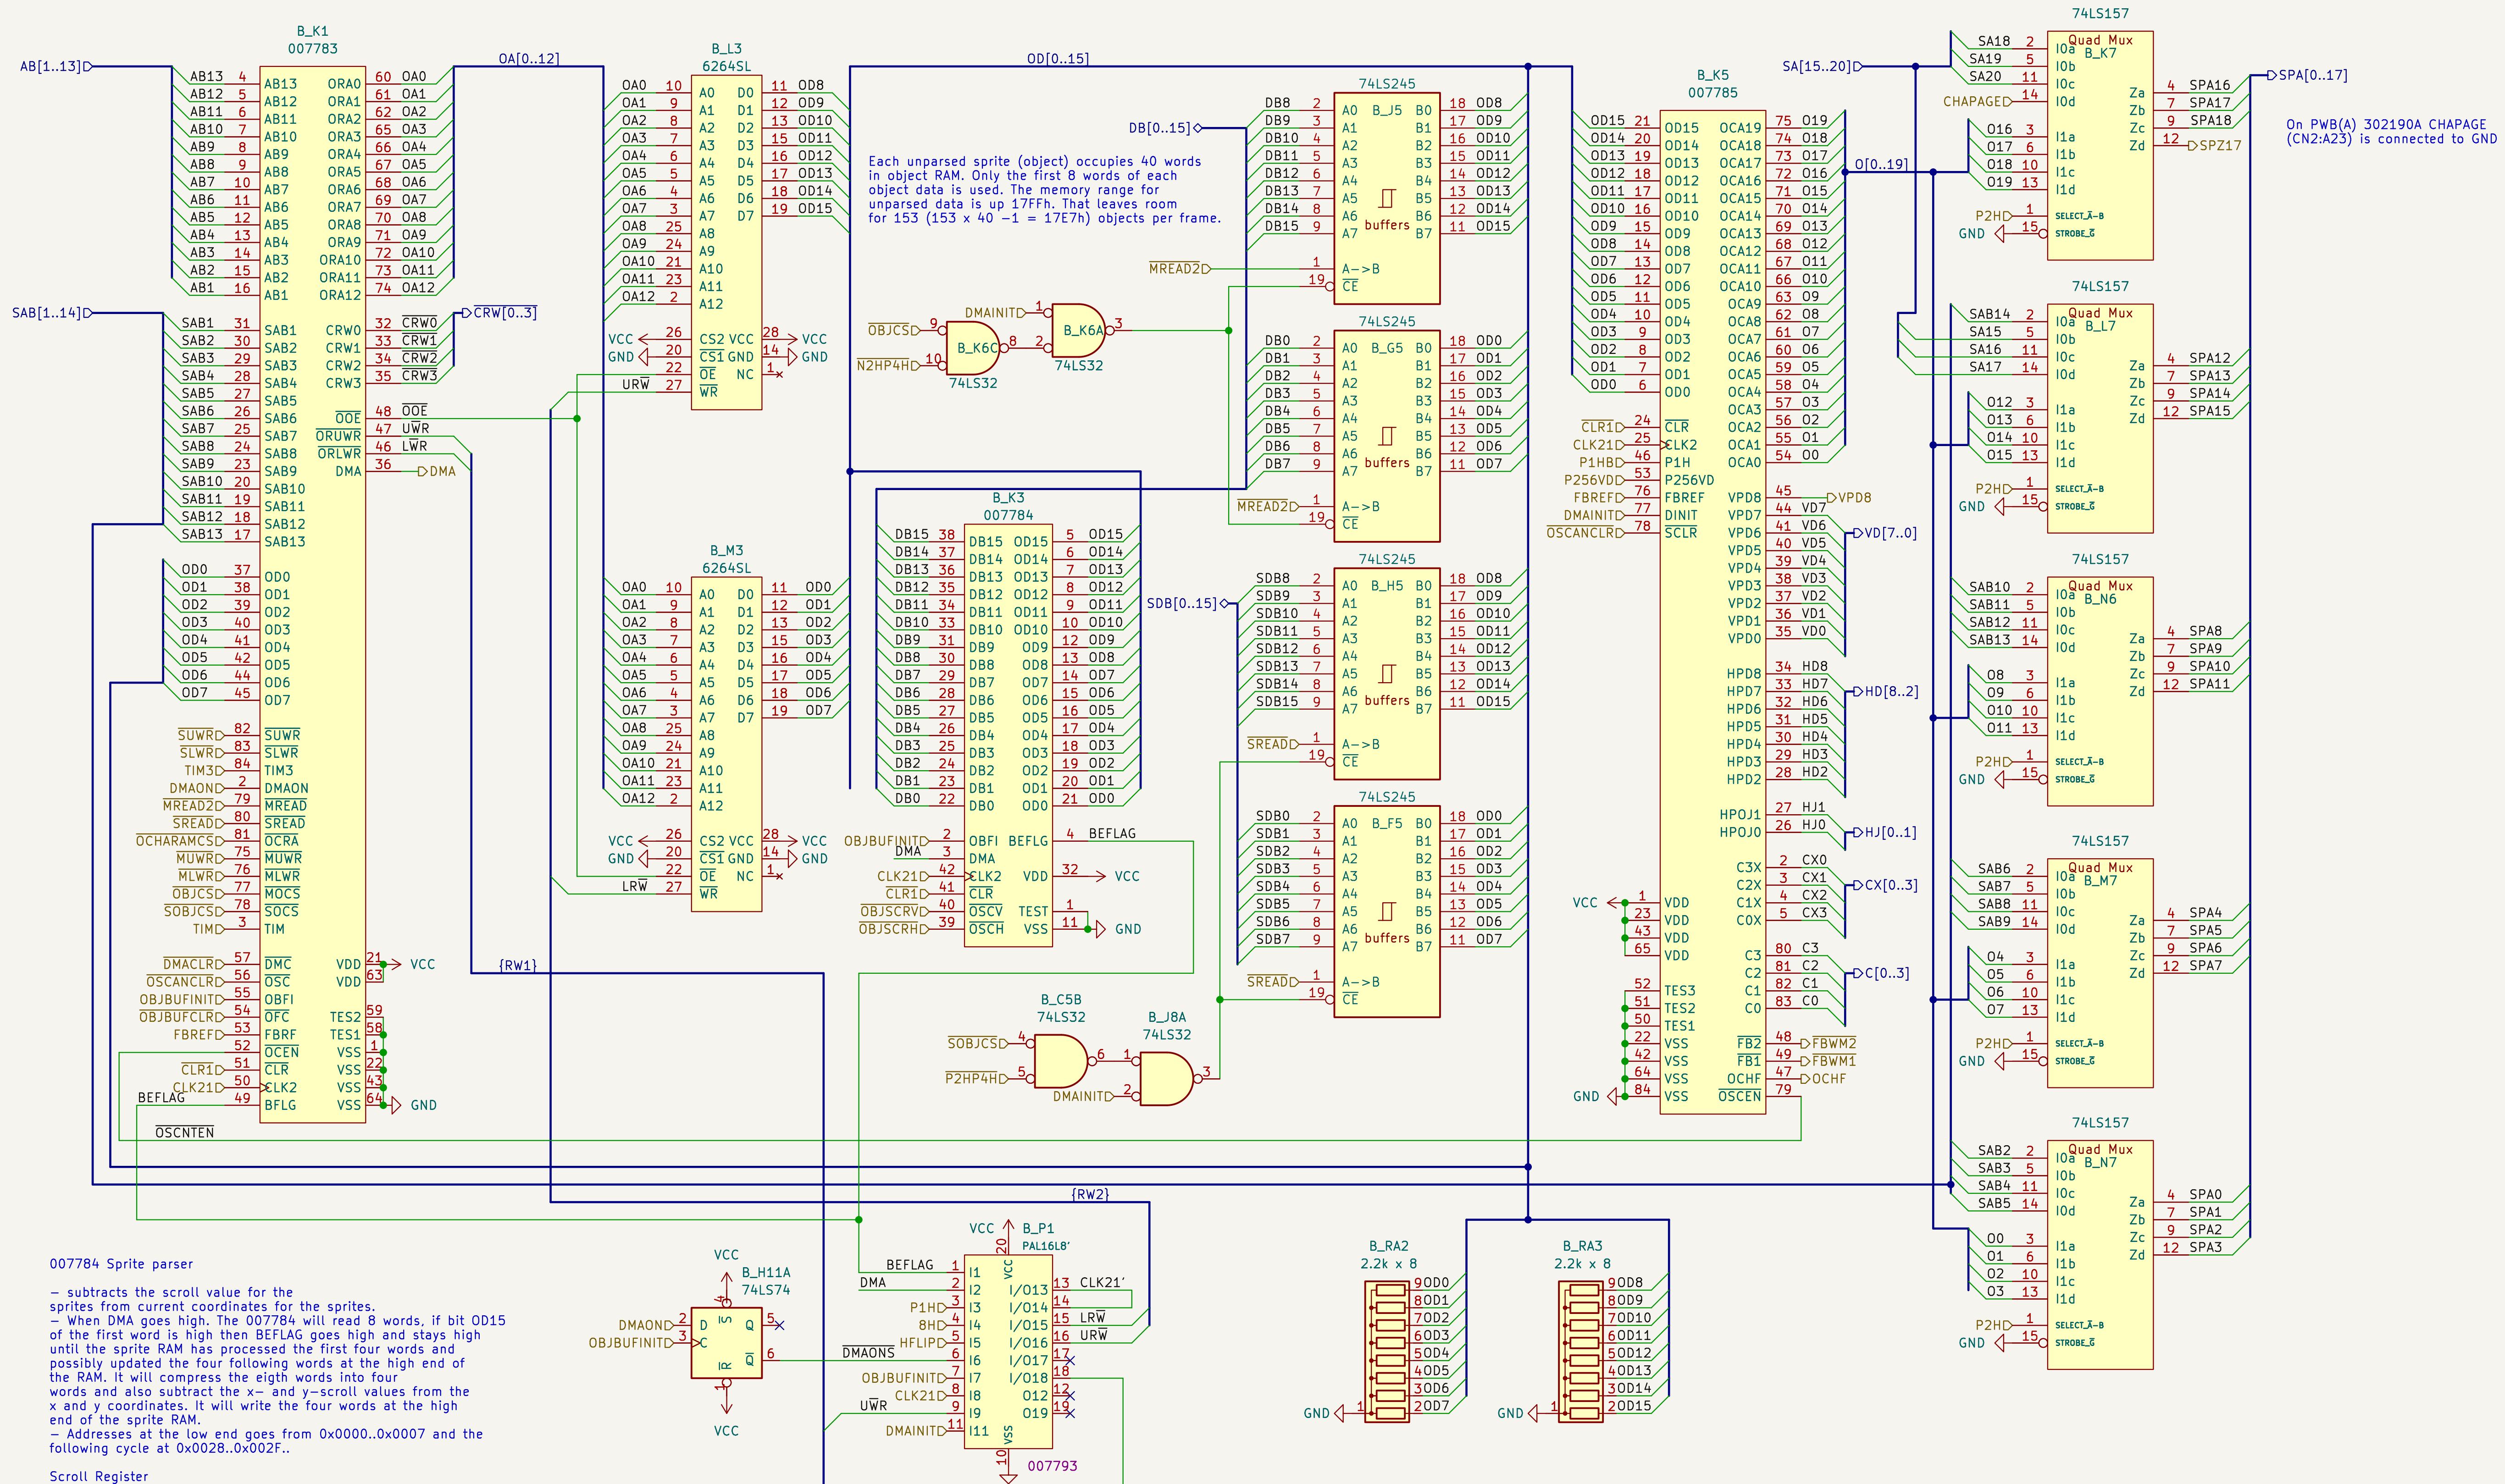
KiCad E.D.A. 8.0.9 | Id: 7/17



007784 Sprite parser

– subtracts the scroll value for the sprites from current coordinates for the sprites.
– When DMA goes high. The 007784 will read 8 words, if bit OD15 of the first word is high then BEFLAG goes high and stays high until the sprite RAM has processed the first four words and possibly updated the four following words at the high end of the RAM. It will compress the eigth words into four words and also subtract the x– and y–scroll values from the x and y coordinates. It will write the four words at the high end of the sprite RAM.
– Addresses at the low end goes from 0x0000..0x0007 and the following cycle at 0x0028..0x002F..

Scroll Register

OBJSCRV Sprite horizontal scroll
OBJSCRH Sprite vertical scroll

Data is latched in the scroll registers when the signals $\overline{\text{OBJSCRV}}$ and $\overline{\text{OBJSCRH}}$ go low.

007793

CLK21' = CLK21

$\overline{\text{LRW}}$ = ~($\overline{\text{DMAONS}}$ & OBJBUFINIT & $\overline{\text{CLK21'}}$ |
$\overline{\text{BEFLAG}}$ & DMA & P1H & $\overline{\text{DMAONS}}$ & CLK21' & (~8H & HFLIP | 8H & ~HFLIP)
~LWR & ~DMAINIT)

$\overline{\text{URW}}$ = ~($\overline{\text{DMAONS}}$ & OBJBUFINIT & $\overline{\text{CLK21'}}$ |
$\overline{\text{BEFLAG}}$ & DMA & P1H & $\overline{\text{DMAONS}}$ & CLK21' & (8H & ~HFLIP | ~8H & HFLIP) |
~UWR & ~DMAINIT)

The sprite memory is controlled in three separate cases:
1. OBJBUFINIT
2. BEFLAG & DMA
3. ~DMAINIT

Frame buffer 1
Frame buffer 2
Not certain which of the parts 6KB,6UB and 6UD are used where. Some errors in the original schematics.
2 x 256kB frame buffers
Framebuffer 1 is outputting pixel data when P256VD is low and writes to the FB is possible when P256VD is high. The conditions are revereseed for FB2.
Writes to FB are possible when the "pixel part" is slected from the mux.
If this expression is true
(R[0:3] != 4'h0) && (FBWM1 | FBWM2 | -WR | ~VPD8)
data is written to DRAM.
Data is written when:
– WR is active.
– Not a transparent pixel (4'h0).
– FBWM1 and FBWM2 are not active: No writes to frame buffer going on.
– VPD8 (vertical counter highest bit, VCNT > 256) is not active. Outside visible area.
Frame buffer 1 Palette color
Frame buffer 2 Palette color

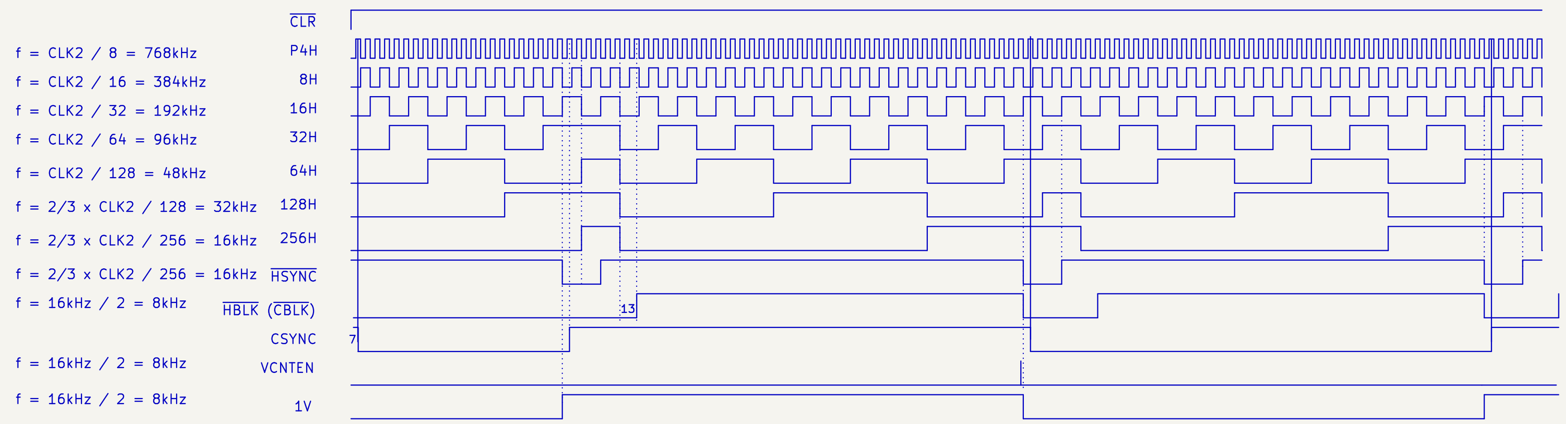
Horizontal signals

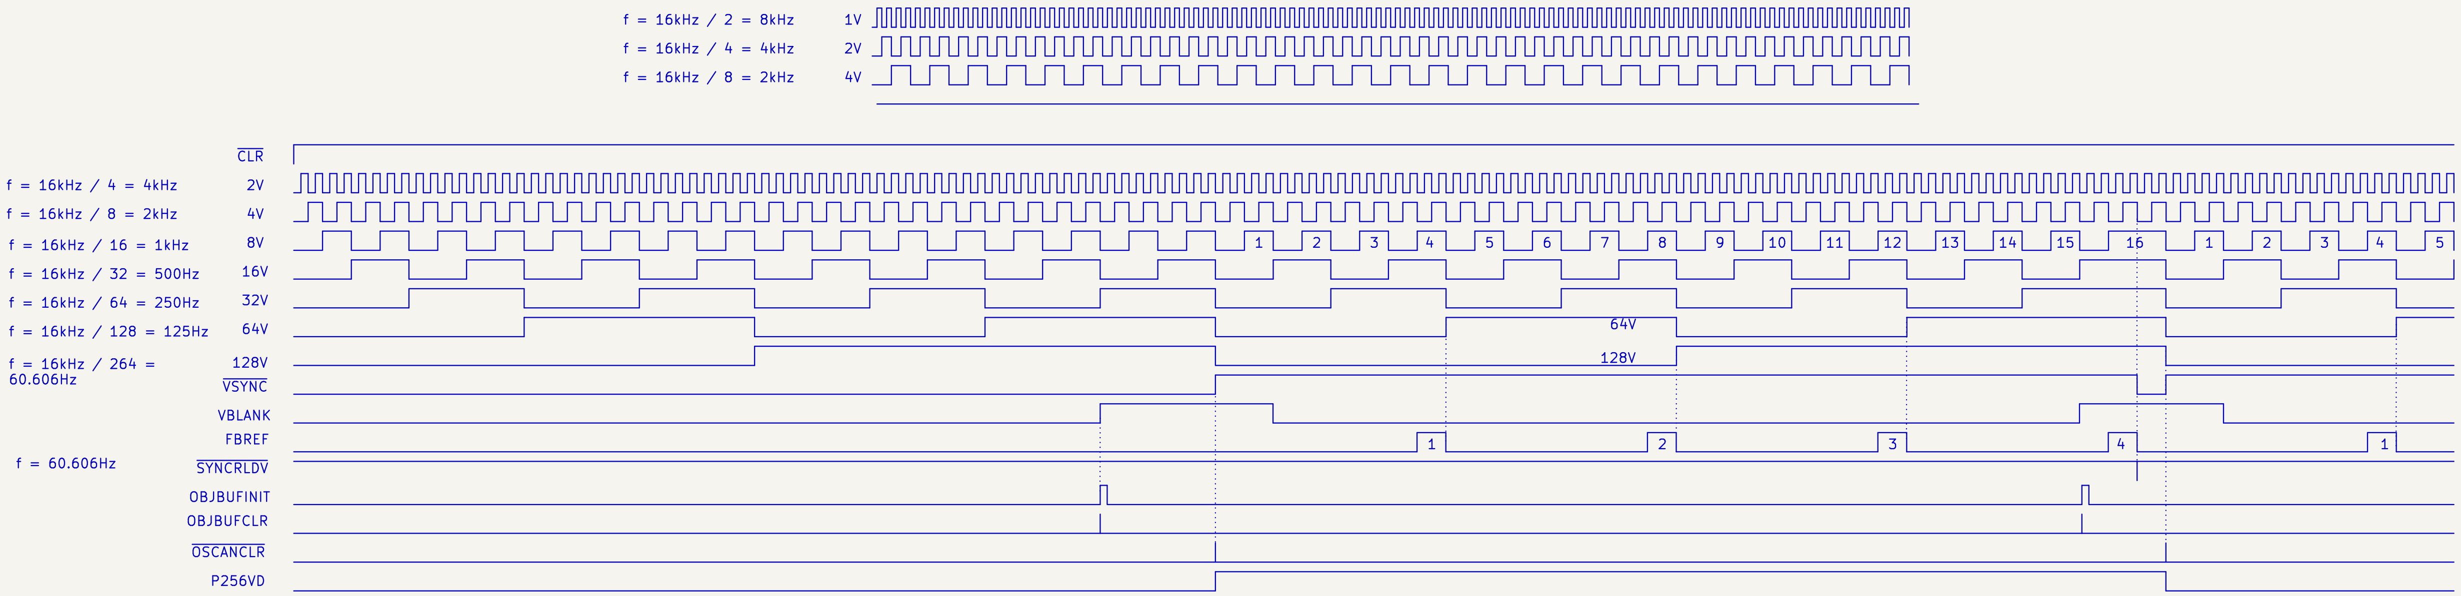


– The first VCNTEN is skipped after reset. It goes low 140ns before HSYNC goes low, and high again when HSYNC goes low. VCNTEN is active right before every second falling edge of HSYNC.

– CPURES goes high, and stays high, on the seventh falling edge of HSYNC.

The first HSYNC is at HCOUNT 175 after reset.

Vertical signals



Every 16th pulse is long.
Every 8th pulse is long.
Every 4th pulse is long.
Every 2nd pulse is long.
High period is longer

VBLANK High: 7 x 16 x 2 = 224, Low: 5 x 4 x 2 = 40

SYNCRLDV goes low 140ns before FBREF goes low. SYNCRLDV goes high again when FBREF goes low.

OBJBUFCLR goes low one pixel clock before the rising edge of VBLANK and high again when VBLANK goes high.

60.606Hz, OSCANCLR goes low for 140ns – One pixel clock cycle.

P256VD goes high/low one P4H cycle (8 pixels) after VSYNC goes high.

FBREF is measured at pin 22. At U186:3 FBREF is delayed by 22ns going high and 12ns going low.

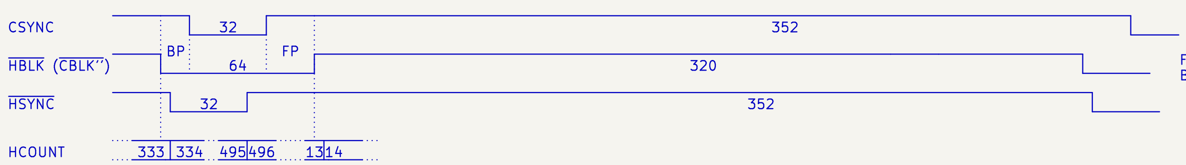
Horizontal and vertical synch timing diagrams

Pixel clock CLK2 = 18.432MHz / 3 = 6.144MHz

Horizontal lines
HSYNC freq = 6.144MHz / 384 = 16kHz
HSYNC period = 1 / 16kHz = 62.5us
Pixels / line: 384
Active pixels: 320
Blank pixels: 64

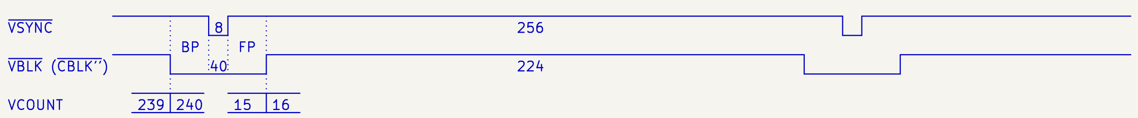
Vertical lines
VSYNC freq = 16kHz / 264 = 60.606060Hz
VSYNC period = 1 / f = 264 / 16kHz = 16.5ms
scanlines / frame: 264
Active lines: 224
Blank lines: 40

The numbers in the HSYNC and HBLK diagrams are HSYNC cycles.
All edges are synchronised to the rising edge of CLK2.



Front Porch (FP) 24 px,
Back Porch (BP) 8 px

The numbers in the VSYNC and VBLK diagrams are HSYNC cycles.
All edges are synchronised to the falling edge of HSYNC.



Front Porch (FP) and
Back Porch (BP) 16 HSYNC cycles.

HCOUNT is bits [256H, 128H, 64H, 32H, 16H, 8H, P4H, P2H, P1H]
VCOUNT is bits [128V, 64V, 32V, 16V, 8V, 4V, 2V, 1V]

CBLK" is at the output of color mixer 007327.
CBLK' is shifted inside the 007327 one pixel clock.
