Leaded EMIFL
Three-terminal Capacitor type
DSS6NE52A222p
2200pF 80/-20%
100Vdc 6A -25 to +85°C

A kind of a track is observed between the two PCB layers, as if it were another layer, but there is no certainty about that. The track seems to be used to delimit or isolate the EMI (ElectroMagnetic Interference) filters. They may have wanted to isolate the noise between digital and analog devices.

KiCad E.D.A. 8.0.9		Id: 23/26

Many of these signals do not look well formed. The PCB uses 74F series for many of these chips, but still cannot get proper digital waveforms.

Removing IC74 breaks the HS/VS alignment between the two video chipsets. The VDP video appears shifted on the screen.

But the HS/VS rate is not affected, so the VDP image still looks stable.

VDP pixel clock and csync generation
